

# Longest Substring with K Distinct Characters (medium)

## We'll cover the following

- Problem Statement
- Try it yourself
- Solution
- Code
  - Time Complexity
  - Space Complexity

## Problem Statement #

Given a string, find the length of the **longest substring** in it **with no more than K distinct characters**.

### Example 1:

Input: String="araaci", K=2

Output: 4

Explanation: The longest substring with no more than '2' distinct characters is "araa".

### Example 2:

Input: String="araaci", K=1

Output: 2

### Example 3:

Input: String="cbbebi", K=3

Output: 5

Explanation: The longest substrings with no more than '3' distinct characters are "cbbeb" & "bbebi".

### Try it yourself #

Java

 Python3

JS

C++

```

1  import java.util.*;
2
3  class LongestSubstringKDistinct {
4      public static int findLength(String str, int k) {
5          // TODO: Write your code here
6          return -1;
7      }
8  }
9

```

Show Results

## Solution #

This problem follows the **Sliding Window** pattern and we can use a similar dynamic sliding window strategy as discussed in [Smallest Subarray with a given sum](#). We can use a **HashMap** to remember the frequency of each character we have processed. Here is how we will solve this problem:

1. First, we will insert characters from the beginning of the string until we have 'K' distinct characters in the **HashMap**.
2. These characters will constitute our sliding window. We are asked to find the longest such window having no more than 'K' distinct characters. We will remember the length of this window as the longest window so far.
3. After this, we will keep adding one character in the sliding window (i.e. slide the window ahead), in a stepwise fashion.
4. In each step, we will try to shrink the window from the beginning if the count of distinct characters in the **HashMap** is larger than 'K'. We will shrink the window until we have no more than 'K' distinct characters in the **HashMap**. This is needed as we intend to find the longest window.
5. While shrinking, we'll decrement the frequency of the character going out of the window and remove it from the **HashMap** if its frequency becomes zero.
6. At the end of each step, we'll check if the current window length is the longest so far, and if so, remember its length.

## Code #

Here is how our algorithm will look:

Java	Python3	C++	JS
<pre> 1  import java.util.*; 2 3  class LongestSubstringKDistinct { 4      public static int findLength(String str, int k) { 5          if (str == null    str.length() == 0    str.length() &lt; k) 6              throw new IllegalArgumentException(); 7 8          int windowStart = 0, maxLength = 0; 9          Map&lt;Character, Integer&gt; charFrequencyMap = new HashMap&lt;&gt;(); 10         // in the following loop we'll try to extend the range [windowStart, windowEnd] </pre>			

```
14     // shrink the sliding window, until we are left with 'k' distinct charact
15     while (charFrequencyMap.size() > k) {
16         char leftChar = str.charAt(windowStart);
17         charFrequencyMap.put(leftChar, charFrequencyMap.get(leftChar) - 1);
18         if (charFrequencyMap.get(leftChar) == 0) {
19             charFrequencyMap.remove(leftChar);
20         }
21         windowStart++; // shrink the window
22     }
23     maxLength = Math.max(maxLength, windowEnd - windowStart + 1); // remember
24 }
25
26 return maxLength;
27 }
28
29 public static void main(String[] args) {
30     System.out.println("Length of the longest substring: " + LongestSubstringKD
31     System.out.println("Length of the longest substring: " + LongestSubstringKD
32     System.out.println("Length of the longest substring: " + LongestSubstringKD
33 }
34 }
35
```

**Output**

2.049s

```
Length of the longest substring: 4
Length of the longest substring: 2
Length of the longest substring: 5
```

### Time Complexity #

The time complexity of the above algorithm will be  $O(N)$  where 'N' is the number of characters in the input string. The outer **for** loop runs for all characters and the inner **while** loop processes each character only once. therefore the time complexity of the algorithm

## Space Complexity #

The space complexity of the algorithm is  $O(K)$ , as we will be storing a maximum of 'K+1' characters in the HashMap.
