

Print Right View of a Binary Tree

Difficulty Level : Medium • Last Updated : 11 Jun, 2022

Given a Binary Tree, print Right view of it. Right view of a Binary Tree is set of nodes visible when tree is visited from Right side.

Right view of following tree is 1 3 7 8

[Recommended Practice](#)[Right View of Binary Tree](#)[Try It!](#)

The problem can be solved using simple recursive traversal. We can keep track of level of a node by passing a parameter to all recursive calls. The idea is to keep track of maximum level also. And traverse the tree in a manner that right subtree is visited before left subtree.

Whenever we see a node whose level is more than maximum level so

implementation of this approach.

C++

```
// C++ program to print right view of Binary Tree
#include <bits/stdc++.h>
using namespace std;

struct Node
{
    int data;
    struct Node *left, *right;
};

// A utility function to
// create a new Binary Tree Node
struct Node *newNode(int item)
{
    struct Node *temp = (struct Node *)malloc(
        sizeof(struct Node));
    temp->data = item;
    temp->left = temp->right = NULL;
    return temp;
}

// Recursive function to print
// right view of a binary tree.
void rightViewUtil(struct Node *root,
                  int level, int *max_level)
{
    // Base Case
    if (root == NULL) return;

    // If this is the last Node of its level
    if (*max_level < level)
    {
        cout << root->data << "\t";
        *max_level = level;
    }
}
```

Output

1 3 7 8

Right view of Binary Tree using Queue

Time Complexity: The function does a simple traversal of the tree, so the complexity is $O(n)$.

Auxiliary Space: $O(n)$

print the right most node of every level. So, we will do a level order traversal on the tree and print the last node at every level. Below is the implementation of above approach:

C++

```
// C++ program to print left view of
// Binary Tree

#include <bits/stdc++.h>
using namespace std;

// A Binary Tree Node
struct Node {
    int data;
    struct Node *left, *right;
};

// Utility function to create a new tree node
Node* newNode(int data)
{
    Node* temp = new Node;
    temp->data = data;
    temp->left = temp->right = NULL;
    return temp;
}

// function to print Right view of
// binary tree
void printRightView(Node* root)
{
    if (root == NULL)
        return;

    queue<Node*> q;
    q.push(root);

    while (!q.empty()) {
        // get number of nodes for each level
```

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our [Cookie Policy](#) & [Privacy Policy](#).

Got It !

```

        Node* x = q.front();
        q.pop();

        // print the last node of each level
        if (n == 0) {
            cout << x->data << " ";
        }
        // if left child is not null push it into the
        // queue
        if (x->left)
            q.push(x->left);
        // if right child is not null push it into the
        // queue
        if (x->right)
            q.push(x->right);
    }
}

// Driver code
int main()
{
    // Let's construct the tree as
    // shown in example

    Node* root = newNode(1);
    root->left = newNode(2);
    root->right = newNode(3);
    root->left->left = newNode(4);
    root->left->right = newNode(5);
    root->right->left = newNode(6);
    root->right->right = newNode(7);
    root->right->left->right = newNode(8);

    printRightView(root);
}

Got It !

```
root.right.right = newNode(7);
root.right.left.right = newNode(8);

printRightView(root);

</script>
```

Output

1 3 7 8

Time Complexity: $O(n)$, where n is the number of nodes in the binary tree.

Auxiliary Space: $O(n)$ since using auxiliary space for queue
